

Suggestions

- Each error is indicated by the file name and line number where it has been identified.
- Check the relative file and search on the indicated line number, considering that the error may have occurred in the previous line.
- Fix first errors at the beginning of the list, since the following errors may be due to previous ones.

```
fun_sd.cpp:13:21: macro "VL" requires 2 arguments, but only 1 given
fun_sd.cpp: In member function `double variable::fun(object*)':
fun_sd.cpp:13: error: `VL' undeclared (first use this function)
fun_sd.cpp:13: error: (Each undeclared identifier is reported only once for each
function it appears in.)
fun_sd.cpp:17: error: expected `;' before "res"
make: *** [fun_sd.o] Error 1
```
